

Goal Description

Convert the 21-part Rudrastra Master Investor Brief into a highly visual, 30-40 slide presentation. Because of system limitations with Python on the host machine, we are pivoting the architecture to **Slidev** (a Node.js based presentation framework). This allows us to use 100% of the taste and impeccable frontend skills, deploying native Tailwind CSS, Vue components, and an **Aesthetic Light Mode** theme.

User Review Required

[!NOTE]

You have already approved this pivot in the chat. Please review this updated architecture and click **Proceed** to begin the execution phase.

Proposed Changes

Phase 1: Environment Setup (Slidev)

We will scaffold a fresh Slidev project inside the scratch directory.

- `npm create slidev@latest rudrastra-deck`
- Configure `tailwind.config.js` to enforce the **Aesthetic Light Mode** (crisp whites, slate text, minimal borders, and strict taste typography rules).
- Configure the Slidev layout engine.

Phase 2: Slide Architecture & Mapping

We will map the 21-part brief into logical slide segments within a single `slides.md` file:

- **Slides 1-5:** The Hook (Problem, Why Now, The One-Sentence Definition)
- **Slides 6-12:** The Architecture (Canonical Data Flow, Product Information Flow, Engineering Assets)
- **Slides 13-18:** The Intelligence Layer (Search & Discovery, BOM Compatibility, Knowledge Brain/Graphify)
- **Slides 19-25:** The Business Engine (Revenue Stack, Ops Control Plane, Four User Systems)
- **Slides 26-30:** Defense & Future (Failure-born architecture, Security, Flywheel, System Map, Takeaway)

Phase 3: High-Fidelity Execution (Impeccable & Taste)

- **Mermaid Diagrams:** Slidev supports Mermaid natively. We will inject the architectural graphs directly and style them with our light-mode palette.
- **ASCII to Web:** We will translate the complex ASCII diagrams (like the Product Information Flow) into structured, CSS-grid layouts using Vue/Tailwind components to ensure they look *impeccable* and premium, rather than like terminal output.
- **Micro-polish:** Apply subtle entry animations (v-click), perfect padding, and high signal-to-noise ratio layouts.

Phase 4: Compilation & Polish

- Launch the Slidev dev server to verify all slides render perfectly.

- Ensure the presentation can be exported to PDF/PPT for your Dubai meeting.

Verification Plan

Automated Tests

- Validate that slides.md parses correctly without Markdown or Vue syntax errors.
- Run npm run build to ensure the final bundle compiles.

Manual Verification

- You will be provided with a local server URL to preview the interactive slides in your browser.
- We will execute the Slidev export command to generate the final PDF for the investor meeting.
